

PLATFORMLESS AI

Private, verifiable AI inference

A drop-in replacement for the OpenAI and Anthropic APIs. Prompts and data stay end-to-end encrypted, and cryptographic proofs verify the GPU actually ran your model - on a marketplace of independent GPU hosts.

Trustless - Private - Sovereign - Verifiable

Production MVP - deploying now

Hacken-audited smart contracts

Sia Foundation grant delivered

A full app (Fabstir v2) already runs on it

Jules Lai | Founder & CTO | London, UK

The Problem

Centralised AI forces a trade-off no serious business should accept

1

Loss of sovereignty

Your data, models and access live at the vendor's discretion - under their jurisdiction, on their terms.

2

Privacy risk

Every prompt sent to a third party's servers; your inputs can train their next model.

3

Single point of failure

One API key, one provider - their outage is your outage, their policy change is your problem.

4

Platform lock-in

OpenAI, Anthropic and Google control access, pricing and what you are allowed to run.

The Paradigm Shift

From platform to protocol

Platform model

- x Centralised control
- x Data on corporate servers
- x Platform sets prices
- x Can revoke access
- x Single point of failure
- x Trust the provider's word

Platformless model

- + Smart-contract coordination
- + End-to-end encrypted
- + Market-driven pricing
- + Permissionless access
- + Fault-tolerant P2P
- + Cryptographic proof, not trust

“We don't trust, we verify.”

How It Works

Encrypted request in, verified result out - no intermediary holds your data

Client layer	SDK-powered apps, encrypted WebSocket
Blockchain layer	Base L2 smart contracts, escrow, settlement
Host layer	LLM inference, image & video generation, vision, transcoding, multi-agent orchestration
Storage layer	S5 / Sia - sovereign decentralised storage

The Trust Stack

Trust through code, mathematics and economic incentives - not reputation

Component	Technology	Guarantee
Proof of storage	Sia network	Sovereign by design
Proof of computation	STARK proofs (Risc0)	Verify inference ran
Content integrity	Blake3 content addressing	Tamper-proof
Communication privacy	XChaCha20-Poly1305, E2E	Private, forward-secret
Full transparency	Open source	Every line auditable
User sovereignty	Wallet-based identity	You control your keys
Contract security	Hacken-audited (complete)	Third-party verified

Traction & Validation

Built and proven - not a slide deck of promises

Technical milestones

- ✓ Full-stack MVP - deploying now (from 20 Oct 2025)
- Smart contracts on Base L2, Hacken-audited (complete)
- STARK proof verification working
- End-to-end encryption on by default
- Sia storage integrated (Enhanced s5.js, grant-delivered)
- Claude Bridge + OpenAI Bridge (drop-in API)
- A2A protocol + x402 USDC micropayments
- Image gen, vision/OCR, semantic search
- AI video generation in Blender - four modes, live
- Decentralised transcoding, load-balanced across hosts

Business validation

- ✓ Sia Foundation grant delivered (early)
- Hacken audit complete - hacken.io/audits/fabstir
- StonesThro / Cornerstone edge infrastructure partnered
- Fabstir v2, a full app, runs on Platformless AI
- Agentic coding proven on decentralised GPUs
- First P2P inference DePIN with A2A protocol
- Multi-agent orchestration (experimental)
- Interest from GPU / cloud providers

New: Verifiable AI Video, Inside Blender

The fastest-growing generative segment - with provenance and privacy built in

Text to video

Generate a clip from a prompt, on your timeline

Image to video

Bring a still frame to life

Keyframe to keyframe

Bridge two stills - first to last frame

Restyle

Recut an existing shot in a new style, keeping its motion and camera

Why it wins: every clip carries cryptographic proof of the model that made it, your input frames stay encrypted, and you pay per clip settled on-chain to the unit - no subscription. It runs on open-weights LTX 2.3 inside a real film/VFX tool (Blender 5.x), not a consumer web app. Verifiable provenance is our wedge as AI-content disclosure rules tighten across film, advertising and news.

Fabstir v2: A Full App on the Protocol

The dogfooding proof - our own product runs entirely on Platformless AI

Fabstir v2 is a film-market deal-flow system and aggregated white-label streaming network. Businesses spin up their own branded streaming platform in minutes; viewers buy credits once and spend them on any content across the whole network. It is built entirely on Platformless AI - so it keeps working even when a centralised vendor retires a model.

Same hardware, three revenue lines

AI inference, media transcoding and RPC caching all run on the same StonesThro edge GPUs - Fabstir's biggest cost centre becomes a revenue line.

On-chain revenue splits

Rights holder and platform agree terms; payment auto-distributes at the moment of consumption. No creative accounting.

Shared verifiable analytics

Both sides see the same numbers - transparency by design.

Sovereign storage

Favourites, history and purchases encrypted on Sia under the user's own identity - no platform database.

Business Model & Market

Multiple revenue streams from one protocol

Revenue model

Protocol fee

10% of inference, transcoding & video-gen payments

Host earnings

90% direct to GPU providers

Enterprise & SaaS

Private AI backends, drop-in API, agentic compute

FAB token

Host staking, network security, governance, fee discounts

Market opportunity

\$400B+

Global AI market by 2025, growing ~35% a year

\$15B+

Agentic AI / AI coding by 2027

\$30B+

AI-powered SaaS by 2027 - all needing private infrastructure

\$22B+

Enterprise AI security (privacy, compliance)

Roadmap

Six of nine phases complete - now shipping and earning

COMPLETE

Infrastructure

- Smart contracts (Hacken-audited)
- P2P encrypted inference + STARK proofs
- S5 / Sia storage (Enhanced s5.js)
- Claude + OpenAI Bridges
- A2A + x402 payments
- AI video generation in Blender

NOW - Q4 2025

Deploy & earn

- MVP deployment (from 20 Oct 2025)
- Non-Multiplex Cinema launches on Fabstir v2
- StonesThro edge revenue begins
- GPU-provider & partner outreach
- FAB token launch preparation

2026

Scale

- Public beta + more verified models
- Enterprise pilots
- Base mainnet + FAB token launch
- Magic Town + Fabstir v2 expansion
- Progressive decentralisation (DAO)

Founder & Partners

Built solo in under 12 months. Audited. First app live. 75% shared with Fabstir.

Jules Lai

Founder & CTO - London, UK

- Built the Platformless AI MVP solo in under 12 months, on personal runway
- Leverages 4 years of prior Fabstir infrastructure - 75% shared codebase
- 25+ years software engineering (C++, full-stack, blockchain)
- BSc Computing (Imperial College London), MSc Financial Mathematics
- Previously Deloitte - lead developer, financial derivatives
- Sia Foundation grant recipient (Enhanced s5.js, delivered early)
- Runs two of the UK's largest film community networks (8,000+ members)

Partners & validation

Hacken

Smart-contract audit (complete)

Sia Foundation

Grant + storage (Enhanced s5.js)

StonesThro / Cornerstone

Edge infrastructure partner

gunnercooke LLP

Legal structure (UK)

Where We're Headed

Revenue-first. Raising from strength, not from a plan.

The hard part is built. The infrastructure is audited, the grant is delivered, and a full application already runs on it. Our next step is revenue, not a raise: we launch Non-Multiplex Cinema on Fabstir v2, StonesThro's edge boxes start earning across inference, transcoding and caching, and we harden the platform under real load.

Already covered

- ✓ Smart-contract audit (Hacken)
- Core development - MVPs delivered
- S5 / Sia integration (grant-funded)
- Claude + OpenAI Bridges
- AI video generation in Blender
- StonesThro / Cornerstone partnered

Funds fuel the next stage

- FAB token launch (staking & network security)
- DevOps / SRE - production scaling
- Compliance & legal (ISO 27001 / 42001)
- Go-to-market & developer relations
- Enterprise pilots

Not raising this moment - launching first. We'd value getting on your radar for when we raise from revenue strength.

Competition

The only architecture that solves agentic-scale privacy by design

Capability	OpenAI	Anthropic	Render	Bittensor	Platformless AI
Decentralised	No	No	Yes	Yes	Yes
End-to-end encrypted	No	No	No	No	Yes
Cryptographic proof of compute	No	No	No	No	STARK
Drop-in OpenAI / Anthropic API	Partial	Partial	No	No	Yes
Verifiable AI video generation	No	No	No	No	Yes
No vendor lock-in	No	No	Yes	Yes	Yes
Privacy guarantee	Trust	Trust	Trust	Trust	Cryptographic
